STANDARD
PERFORATED

ULTRA CAP
PERFORATED

QC Screen Company has a high performance screen pattern available that can increase the efficiency and performance of your air/screen cleaner. This design provides a higher percent of open area by punching holes closer together. Typically, most perforated screens have 35 - 45% open area in round and oblong shapes.

With QC's state-of-the-art perforating equipment, the open area can often be increased by 15 - 35% depending on hole size and configuration. This has increased screening performance and efficiency in virtually every application tested.

Contact us today to see if we can increase your production with minimal costs and maximum performance.
